

FIELD RESPONSE

Rapid Response: Managing Critical Equipment Repair

The best emergency repair process restores safe operation quickly without turning a temporary fix into the next failure.

THE ENGINEERING POINT

Restore function fast - then verify the permanent solution.

WHAT YOU'LL TAKE AWAY

1

Stabilize first

Identify the failed function, isolate hazards, protect critical loads, and establish temporary operating needs.

2

Repair with compatibility in mind

Verify ratings, fit, protection, controls, and listing implications before replacing components.

3

Close the loop

Test the repaired system, document changes, and convert temporary measures into a permanent plan.
